What this presentation covers

About FitPro

FitPro is an online fitness training platform built in Java. Trainers publish workout programs, and members enrol, log their sessions and track the calories they burn.

This presentation explains the problem, the design, how the code is built, and a walkthrough of the working screens.

2	4	6
user roles	database tables	servlets

1 **Problem and features** — Slides 3-4
Why FitPro exists and what each role can do

2 **Application screens** — Slides 5-7
Login, dashboard and workout catalogue

3 **Core Java implementation** — Slides 8-11
OOP, collections, threads, JDBC, servlets, security

4 **Technology and design** — Slides 12-16
Stack, MVC architecture, project structure, database

5 **Rubric, demo and future scope** — Slides 17-18
Marks coverage, demo order and next steps

The problem and our solution

The problem

- Gym memberships are costly and time-bound
- Workouts are rarely tracked, so progress is invisible
- Trainers have no simple way to publish structured programs
- Members cannot see calories or trends in one place

Our solution

- One web platform for members and trainers
- Trainers publish Cardio, Strength and Yoga programs
- Members enrol, log sessions and see calories burned
- Dashboard turns raw logs into clear statistics

Key features by role

Member

- Register and log in securely
- Browse and filter workouts by type
- Enrol in programs
- Log minutes and body weight
- See calories, totals and a chart

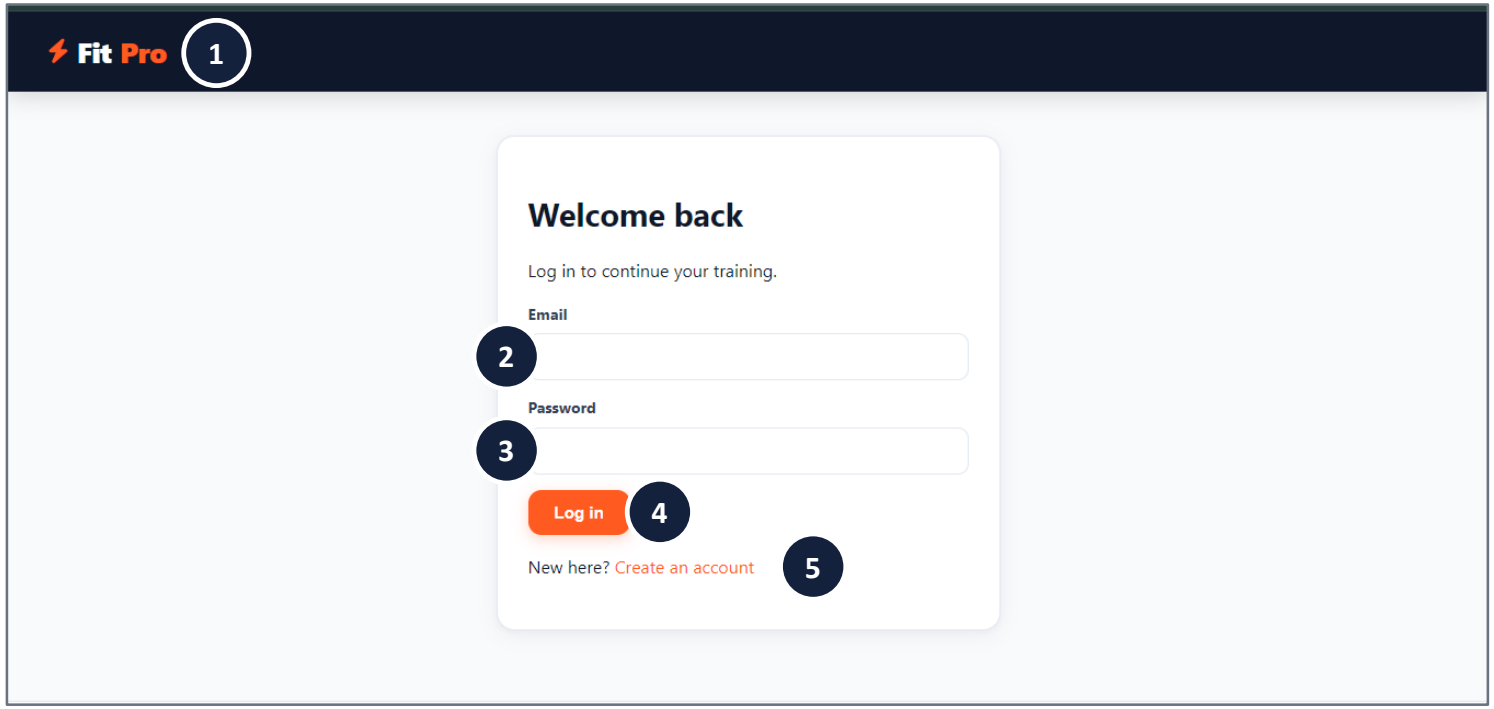

Trainer

- Register and log in securely
- Publish programs with level and intensity
- Choose Cardio, Strength or Yoga
- Programs appear for every member
- Role-specific dashboard

Shared: password hashing, session login, input validation, friendly error messages

Screen 1: Login page

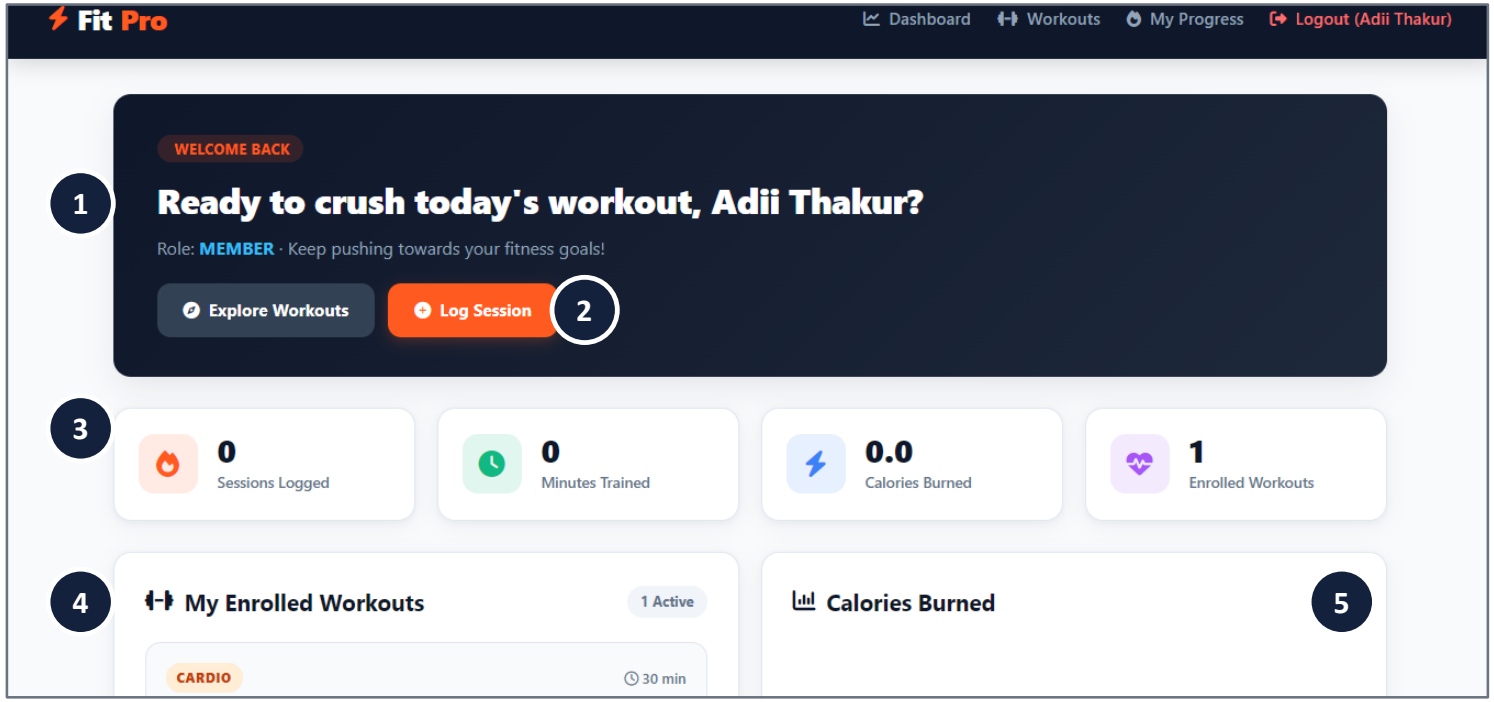

Behind this screen: POST /login

login.jsp > LoginServlet > AuthService > UserDAO > users table

Screen walkthrough

1. **Brand bar:** FitPro logo shown on every page.
2. **Email field:** Required; format checked in the browser, then again on the server.
3. **Password field:** Sent by POST and compared with the stored PBKDF2 hash.
4. **Log in button:** Starts a fresh session, then opens the dashboard.
5. **Create an account:** Link to the registration page (Member or Trainer).

Screen 2: Member dashboard

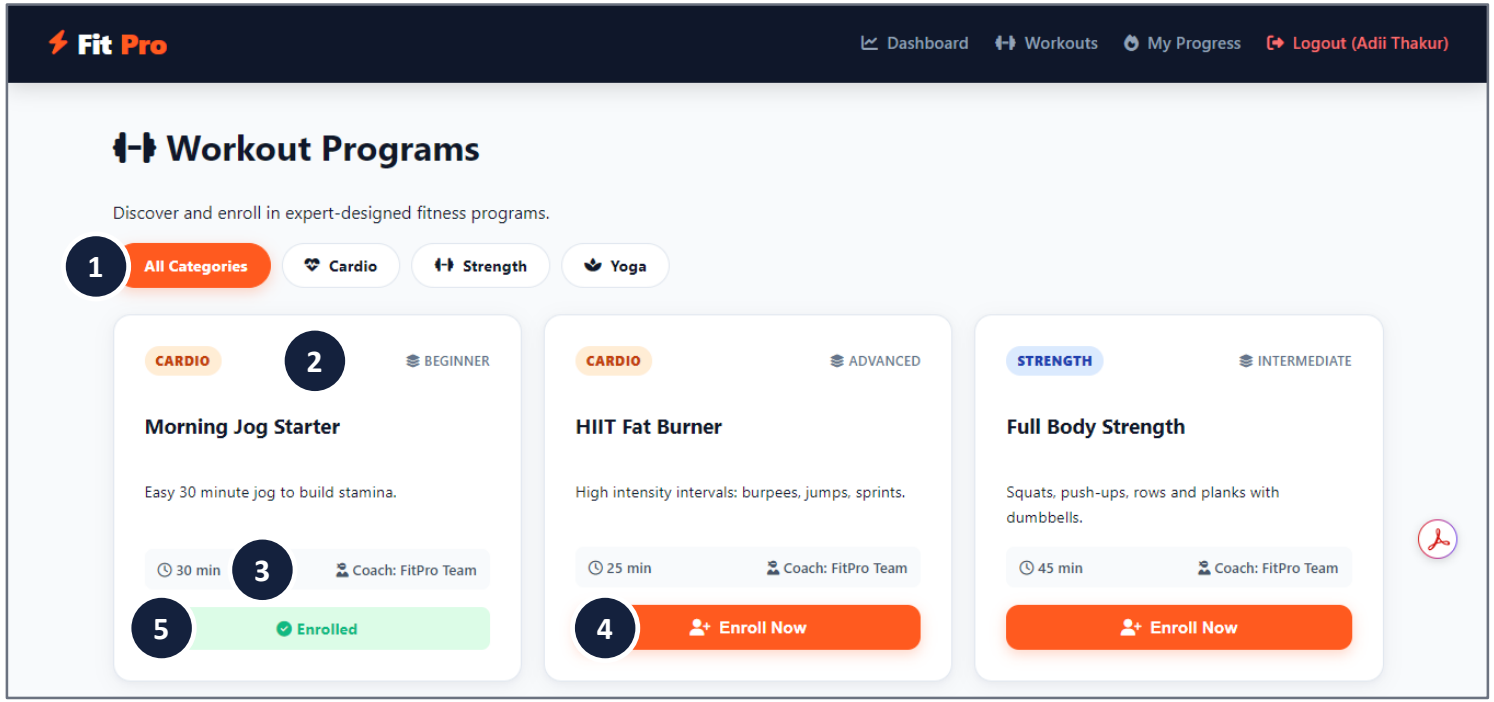

Behind this screen: GET /app/dashboard

DashboardServlet > ProgressService, WorkoutService > dashboard.jsp

Screen walkthrough

1. **Welcome banner:** Greeting and role badge (MEMBER) come from the logged-in user object.
2. **Quick actions:** Jump to Workouts or log a session in one click.
3. **Stat cards:** Sessions, minutes, calories burned and enrolled programs.
4. **My Enrolled Workouts:** Programs the member joined, with type and duration.
5. **Calories Burned:** Chart that fills in after the first logged session.

Screen 3: Workout programs

Behind this screen: GET and POST /app/workouts

WorkoutServlet > WorkoutService > WorkoutDAO, EnrollmentDAO > workouts.jsp

Screen walkthrough

1. **Category chips:** Filter the catalogue by All, Cardio, Strength or Yoga.
2. **Type and level badges:** Colour-coded so programs can be scanned quickly.
3. **Duration and coach:** Shown on every card; FitPro Team for built-in programs.
4. **Enroll Now:** Saves the enrolment in the database and sends a notification.
5. **Enrolled state:** Turns green once joined, and duplicate enrolments are blocked.

Technology stack

Frontend

JSP, JSTL, HTML5, CSS3, vanilla JavaScript

Backend

Java 11, Servlets 4.0, Filters, Listeners

Database

MySQL 8 accessed through JDBC

Build

Maven, packaged as a WAR file

Server

Apache Tomcat 9 (javax.servlet)

Chosen to cover the rubric directly: Core Java, JDBC database integration, and Servlets with web integration.

Layered MVC architecture

AuthFilter

Every /app/* request is checked for a logged-in session before it reaches a servlet.

Service layer

Validation and rules live here, so servlets stay thin and DAOs contain only SQL.

Listener and threads

AppContextListener stops the notification thread pool when the app is undeployed.

Project structure

```
fitpro/
|-- pom.xml
|-- README.md
|-- database/schema.sql
`-- src/main/
    |-- java/com/fitpro/
    |   |-- model/     entities (OOP)
    |   |-- dao/       JDBC classes
    |   |-- service/   business logic
    |   |-- servlet/   controllers
    |   |-- filter/ listener/
    |   `-- util/ exception/
    |-- resources/db.properties
    `-- webapp/ css, js, JSP views
```

29
Java classes

7
JSP pages

4
DB tables

6
Servlets

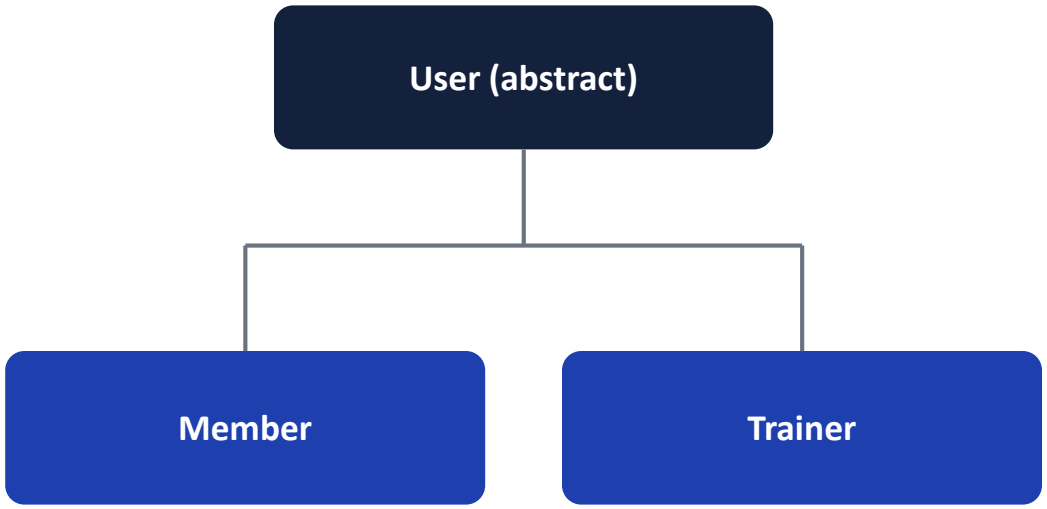

Database design

users	workouts	enrollments	progress_logs
id (PK)	id (PK)	id (PK)	id (PK)
full_name	title, description	user_id (FK)	user_id (FK)
email (UNIQUE)	type, level	workout_id (FK)	workout_id (FK)
password_hash	duration_min	enrolled_at	minutes, weight_kg
role: MEMBER / TRAINER	met_value	UNIQUE(user, workout)	calories
	trainer_id (FK)		logged_on

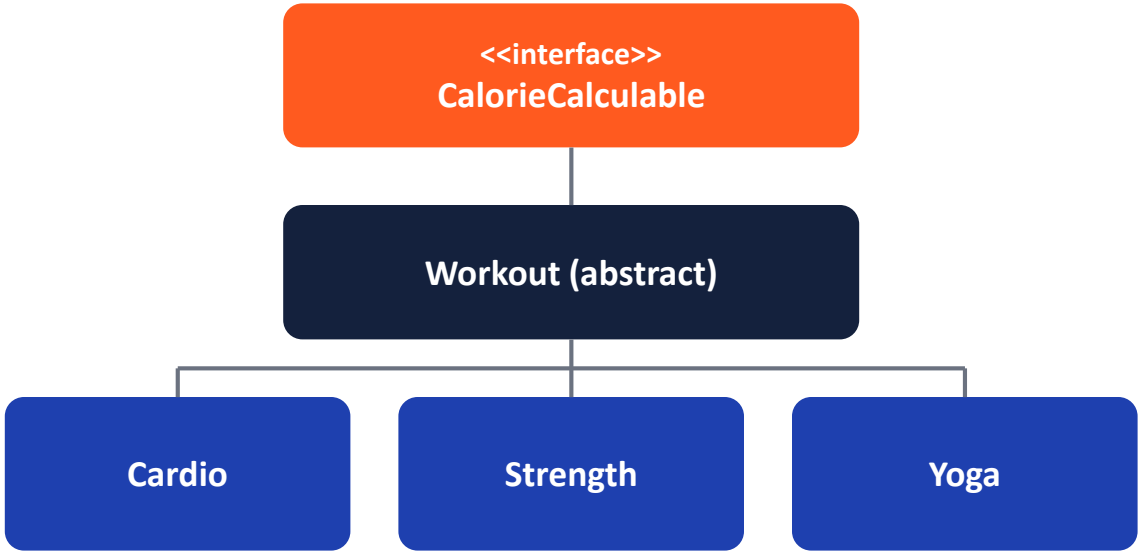

users 1 : N workouts (trainer publishes)
users N : M workouts through enrollments | users 1 : N progress_logs

OOP: inheritance, interfaces, polymorphism

Inheritance and abstraction

Interface and polymorphism

One call, different behaviour: workout.caloriesBurned(70 kg, 30 min)

MET 5 -> Cardio 183.8 kcal | Strength 202.1 kcal (+10% afterburn) | Yoga 165.4 kcal (-10%)

Collections, generics and exception handling

Collections and generics

- Generic interface BaseDAO<T, ID>
- List<Workout> for the catalogue
- Set<Integer> for fast enrolled checks
- TreeMap + streams: calories per workout
- Optional<T> instead of null returns

Exception handling

- Custom checked AppException
- DAOs wrap SQLException with clear messages
- try-with-resources closes every connection
- Servlets catch and show a friendly alert
- Login errors stay generic (no user hints)

```
public interface BaseDAO<T, ID> {
    Optional<T> findById(ID id) throws AppException;
    List<T> findAll() throws AppException;
}
```

Multithreading and synchronization

Why threads here?

- Registration returns instantly
- ExecutorService with 2 worker threads
- Shared counter guarded by synchronized
- Pool shut down cleanly by the listener
- Real gateway (email/SMS) can replace the stub

```
pool.submit(() -> {
    Thread.sleep(300);      // gateway delay
    int n = increment();    // thread-safe
    LOG.info("notification #" + n);
});

private synchronized int increment() {
    return ++sentCount;
}
```

JDBC and servlet integration

JDBC layer

- DBConnection loads the driver and settings once
- db.properties, overridable by environment variables
- PreparedStatement for every query
- try-with-resources for connections and results
- Four DAOs: User, Workout, Enrollment, Progress

URL	Servlet and purpose
/login	LoginServlet: authenticate
/register	RegisterServlet: sign up
/app/dashboard	DashboardServlet: statistics
/app/workouts	WorkoutServlet: list, enrol, publish
/app/progress	ProgressServlet: log sessions
/app/logout	LogoutServlet: end session

Every /app/* URL passes through AuthFilter first.

Security measures

Password hashing

PBKDF2-HMAC-SHA256 with a random salt. Plain passwords are never stored.

SQL injection

Every query uses PreparedStatement with bound parameters.

Cross-site scripting

All JSP output goes through c:out so user text is escaped.

Sessions and roles

Session regenerated at login, HttpOnly cookies, role checks on the server.

Rubric coverage

Criterion	Marks	Evidence in FitPro
Problem understanding and solution design	8	Role-based platform, layered MVC design
Core Java concepts	10	OOP, collections, generics, exceptions, threads
Database integration (JDBC)	8	DBConnection, 4 DAOs, PreparedStatement
Servlets and web integration	7	6 servlets, filter, listener, JSP and JSTL

33

marks addressed

Bonus: topics from the GUI rubric are also covered (collections, threads, DB classes).

Live demo flow and future scope

1. Register a Trainer and publish a program
2. Register a Member and browse workouts
3. Enrol in a program from the catalogue
4. Log a session and open the dashboard

Future scope

- CSRF tokens on all forms
- Admin approval for trainer accounts
- Video lessons and weekly goals
- Charts with Chart.js
- REST API / Spring Boot version
